

Kodin AI Practical Evaluation Report

Student: Parneet

Date: 25/9/2026, 3:15:10 pm

Evaluated: 2026-09-25T15:15:09.993066+05:30

Total Score: 40 / 100

Algorithm: 40 / 40 marks

Code: 0 / 40 marks

Output: 0 / 20 marks

Algorithm Feedback

The algorithm outlines a clear, step by step approach that matches the problem statement. It correctly identifies the abstract class, the two subclasses, and the required method overrides, as well as the main method logic to instantiate and invoke the methods.

Code Feedback

No code was provided, so the implementation cannot be evaluated. The student would need to write the Java classes and main method to demonstrate the logic described in the algorithm.

Output Feedback

No program output was captured. Without a compiled program, it is impossible to verify that the messages for starting the car and motorcycle are displayed correctly.

Strengths

- Algorithm is comprehensive and follows the required sequence.
- All necessary components (abstract class, subclasses, method overrides, main method) are identified.

Areas to Improve

- Provide the actual Java source files implementing the described classes and methods.
- Compile and run the program to generate output, then capture and submit the console output for evaluation.
