

Kodin AI Practical Evaluation Report

Student: Parneet

Date: 30/9/2026, 11:49:01 pm

Evaluated: 2026-09-30T23:49:00.142660+05:30

Total Score: 100 / 100

Algorithm: 40 / 40 marks

Code: 40 / 40 marks

Output: 20 / 20 marks

Algorithm Feedback

The algorithm is clear and follows a logical sequence from class definition to object instantiation and method invocation. It includes a validation step, which is a thoughtful addition even though not required. The steps are concise and directly address the problem statement.

Code Feedback

The code correctly implements the Student class with encapsulated fields, a constructor, and a method to display details. It creates two objects and calls the display method, producing the expected output. The only minor discrepancy is the method name case, but it is consistently used throughout the code.

Output Feedback

The program runs successfully and the output matches the expected format, showing both student details after a header line. All required information is displayed correctly.

Strengths

- Clear, step-by-step algorithm
- Proper encapsulation of class attributes
- Correct object creation and method usage
- Output matches specification

Areas to Improve

- Align method name with the algorithm description (e.g., displayDetails)
- Add input validation in the constructor or display method
- Consider using getters for better encapsulation
