

Kodin AI Practical Evaluation Report

Student: Parneet

Date: 25/9/2026, 3:17:47 pm

Evaluated: 2026-09-25T15:17:46.645856+05:30

Total Score: 100 / 100

Algorithm: 40 / 40 marks

Code: 40 / 40 marks

Output: 20 / 20 marks

Algorithm Feedback

The algorithm outlines all required steps, from defining the abstract class to creating and invoking the subclasses. It clearly specifies the sequence of actions and covers both vehicle types. The steps are concise yet complete, matching the problem statement.

Code Feedback

The Java code correctly implements the abstract class and its subclasses, overriding the `startEngine()` method with appropriate messages. The main method instantiates both vehicles and calls the methods, producing the expected output. The use of `@Override` annotations and proper method signatures demonstrates good understanding of Java inheritance.

Output Feedback

The program runs successfully and prints the exact messages required for both the car and motorcycle. The output matches the expected behavior, confirming that the implementation works as intended.

Strengths

- Correct use of abstract class and method overriding
- Clear and functional main method
- Accurate output messages
- Concise and readable code

Areas to Improve

- Follow Java naming conventions by capitalizing class names (e.g., `Code` instead of `code`)
- Consider adding a package declaration for better organization
