

Kodin Code Session Report - Parneet

Date: 18/9/2026, 2:34:05 pm

QUESTION

Demonstrate Single level Inheritance in Java .

Question images

AIM

Demonstrate Single level Inheritance in Java

ALGORITHM

- Step 1: Start
- Step 2: Define the parent class Animal with variable name and method show() to display the name
- Step 3: Define the child class Rabbit that inherits from Animal using the extends keyword, containing variable age and method Eat()
- Step 4: Define the main class code containing the main method
- Step 5: Create an object a1 of the parent class Animal and set its name
- Step 6: Create an object r1 of the child class Rabbit
- Step 7: Set the inherited name variable for r1, then call the inherited show() method and child-specific Eat() method
- Step 8: Stop

SOLUTIONS

File: code.java

```
class Animal
{
    String name;
    void show()
    {
        System.out.println("Inside show method");
        System.out.println("Name: "+name);
    }
}
class Rabbit extends Animal
{
    int age;
    void Eat()
    {
        System.out.println("Eats carrorts");
    }
}
```

```
}  
class code  
{  
    public static void main (String args[])  
    {  
        Animal a1 = new Animal();  
        a1.name = "Small Animal";  
        Rabbit r1 = new Rabbit();  
        r1.name = "Rabbit";  
        r1.show();  
        r1.Eat();  
    }  
}
```

PROGRAM OUTPUT

```
===== code.java =====  
Inside show method  
Name: Rabbit  
Eats carrorts
```

CONCLUSION

Single level Inheritance was successfully demonstrated.

#	Question	Correct Answer	Your Answer	Result
1	What is the exact output of the program when it is executed?	Inside show method Name: Rabbit Eats carrorts	Inside show method Name: Rabbit Eats carrorts	Correct
2	Which statement about inheritance in this code is correct?	Rabbit inherits public and protected members from Animal, but not private ones.	Rabbit inherits public and protected members from Animal, but not private ones.	Correct
3	If the declaration is changed to <code>`Animal a1 = new Rabbit(); a1.show();`</code> , what will be printed?	Inside show method Name: Rabbit	Inside show method Name: Small Animal	Wrong
4	Which of the following is NOT a field of the Rabbit class?	show()	show()	Correct
5	If a new method <code>`void show() { System.out.println("Rabbit show");}`</code> is added to Rabbit, what will <code>`r1.show();`</code> print?	Rabbit show	Rabbit show	Correct
