Date: 1/10/2026, 12:45:30 am

Evaluated: 2026-10-01T00:45:29.803202+05:30

Total Score: 100 / 100

Algorithm: 40 / 40 marks

Code: 40 / 40 marks

Output: 20 / 20 marks

Algorithm Feedback

The algorithm clearly outlines all required steps, from defining the superclass to overriding methods in subclasses and using a polymorphic reference. It follows a logical sequence that matches the problem statement and ensures runtime polymorphism is demonstrated. The steps are concise yet complete, covering construction and method calls. Minor enhancement could include a note about invoking the base method for completeness.

Code Feedback

The code correctly implements inheritance, method overriding, and runtime polymorphism. Constructors properly initialize instance variables and overridden methods compute and display salaries as required. The main method demonstrates dynamic dispatch with an Employee reference. The implementation is straightforward, functional, and free of syntax errors.

Output Feedback

The program runs successfully and prints the expected salary calculations for both full time and part time employees. The output clearly shows that the overridden methods are invoked, demonstrating polymorphism. It matches the demonstration of the required behavior.

Strengths

- Correct use of inheritance and method overriding
- Clear constructors and instance variable initialization
- Proper demonstration of runtime polymorphism
- Program compiles and runs with expected output

Areas to Improve

- Consider calling `super.calculateSalary()` in overridden methods to show base behavior
- Add input validation to guard against negative salary values
